## **DETAILED ACTION**

### ***Claim Rejections - 35 USC § 103***

1. Rejections set forth previously under this section are withdrawn.

### ***Allowable Subject Matter***

2. **Claims 21-27 and 29-39** are allowed.
3. The following is an examiner's statement of reasons for allowance:

With respect to Claim 21, the prior art does not teach or fairly suggest the subject matter of Claim 21 as a whole, especially a plug disposed within the chamber at an end of the spindle opposite that connected to the actuator, the spindle having two larger diameter portions adjacent its two ends. The claimed invention requires a spindle with larger diameter portions adjacent its two ends *in addition to a plug*. The plug must be capable of remaining in communication with the injection port to block the injection port when the spindle retracts from the deployed position. Further, the injection head is removable from the injection port such that the plug remains blocking the injection port and the end of the spindle opposite the actuator remains sealing off the outlet after the injection head is removed from the injection port. These things are not taught or suggested by the prior art. Clark does not teach a plug in addition to a spindle with larger diameter portions, such that the injection port would be blocked by the plug, the spindle sealing off the outlet, and the injection head being removable from the injection port. The separable and removable nature of the components recited by Claim 21 is, therefore, not taught or suggested by the prior art.

Art Unit: 1791

With respect to Claim 38, the prior art does not teach or fairly suggest the subject matter of Claim 38 as a whole, especially a plug disposed within the chamber at an end of the spindle opposite that connected to the actuator, the plug blocking an injection port such that when the injection head is removed from the injection port, the plug is capable of remaining in communication with the injection port to block the injection port. In other words, the injection head must be releasably connected to the port, and the plug must be separable from the spindle in order for the plug to remain in communication with the injection plug to block the injection port. These things are not taught or suggested by the prior art. While Brew does teach a spindle there is no plug which would be capable of remaining in communication with the injection port to block the injection port when the injection head is removed.
